ArtConnect Application

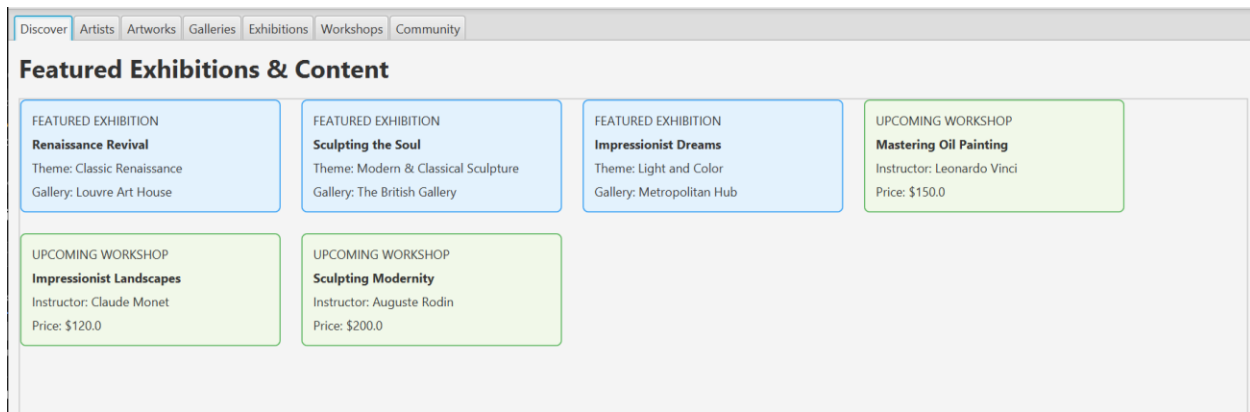

PROJECT DESCRIPTION	1
ARTCONNECT APPLICATION.....	1
STEP 1: UNDERSTANDING ARTCONNECT AND DEFINING THE FUNCTIONAL SCOPE	3
1. EXPLORING THE PROVIDED APPLICATION	3
2. FUNCTIONAL ANALYSIS.....	4
<i>Use case diagram</i>	5
3. STATIC DESIGN	6
<i>Class diagrams</i>	6

Step 1: Understanding ArtConnect and Defining the Functional Scope

Objective: Understand the provided application, define your functional vision of ArtConnect, and set the exact scope you will implement in the database.

1. Exploring the application provided

After downloading JavaFX, when we run the `MainApp.java` we have the following screen.

The main screens are displayed as tabs on the screen; here is a breakdown of the different tabs.

Discover	The discover tab allows the user to see the upcoming exhibitions and workshops. - Exhibitions contain, name, theme and their locations - Workshops contain, name, instructor and price
Artists	Description of each artist with their name, city, email and birth year.
Artworks	A table containing all the information on an artwork such as its name, the artist who created it, the type of art, its price and its status.
Galleries	Is a list of all galleries with their name, address and review out of 5
Exhibitions	Is a table containing all the information on exhibitions. We have the name of the exhibition, the gallery where it is, the starting date and theme.
Workshops	Is a table containing all the information on workshop. We have the name of the workshop, the name of the instructor, the date and time of workshop, the price and the level needed for this workshop.
Community	Table containing all the art community affiliated with the app. We have the name, email to contact them and the city location.

2. Functional analysis

Main features from the user's perspective

From the user perspective, we can see 7 different tabs representing different features that the user has access to. The features are:

- Discover
- Artists
- Artworks
- Galleries
- Exhibitions
- Workshops
- Community

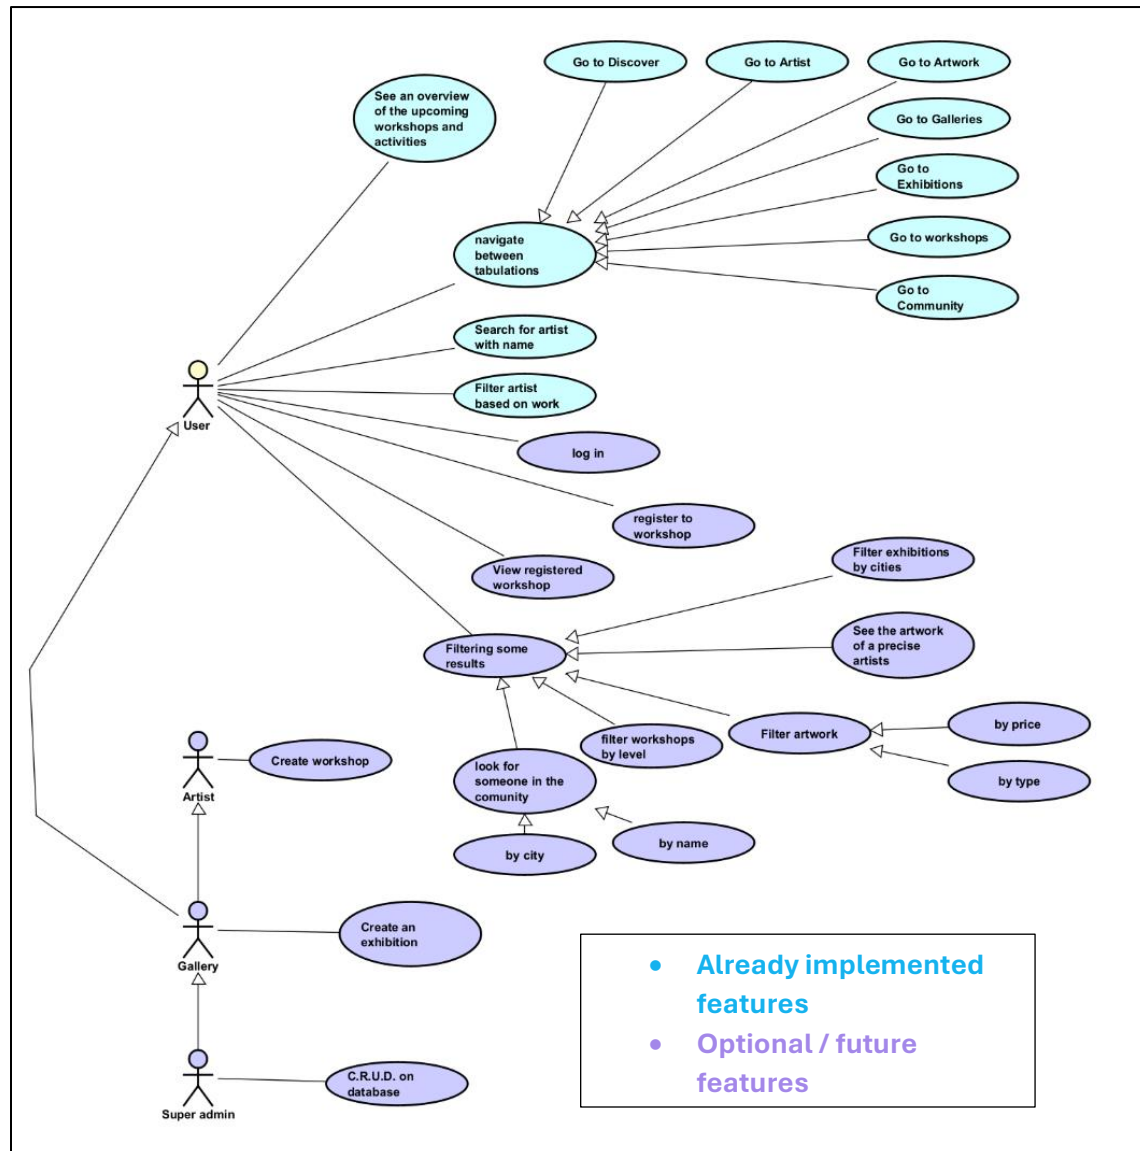

Role's identification

We can identify the following roles:

- Visitors, that are signed up to receive potential newsletters or signing up to workshops
- Super admin, that can see and do everything on the website
- Gallery admin, each gallery has its own admin that can modify / create / delete workshops
- Artists that can create workshops and see their future events.

Use case diagram

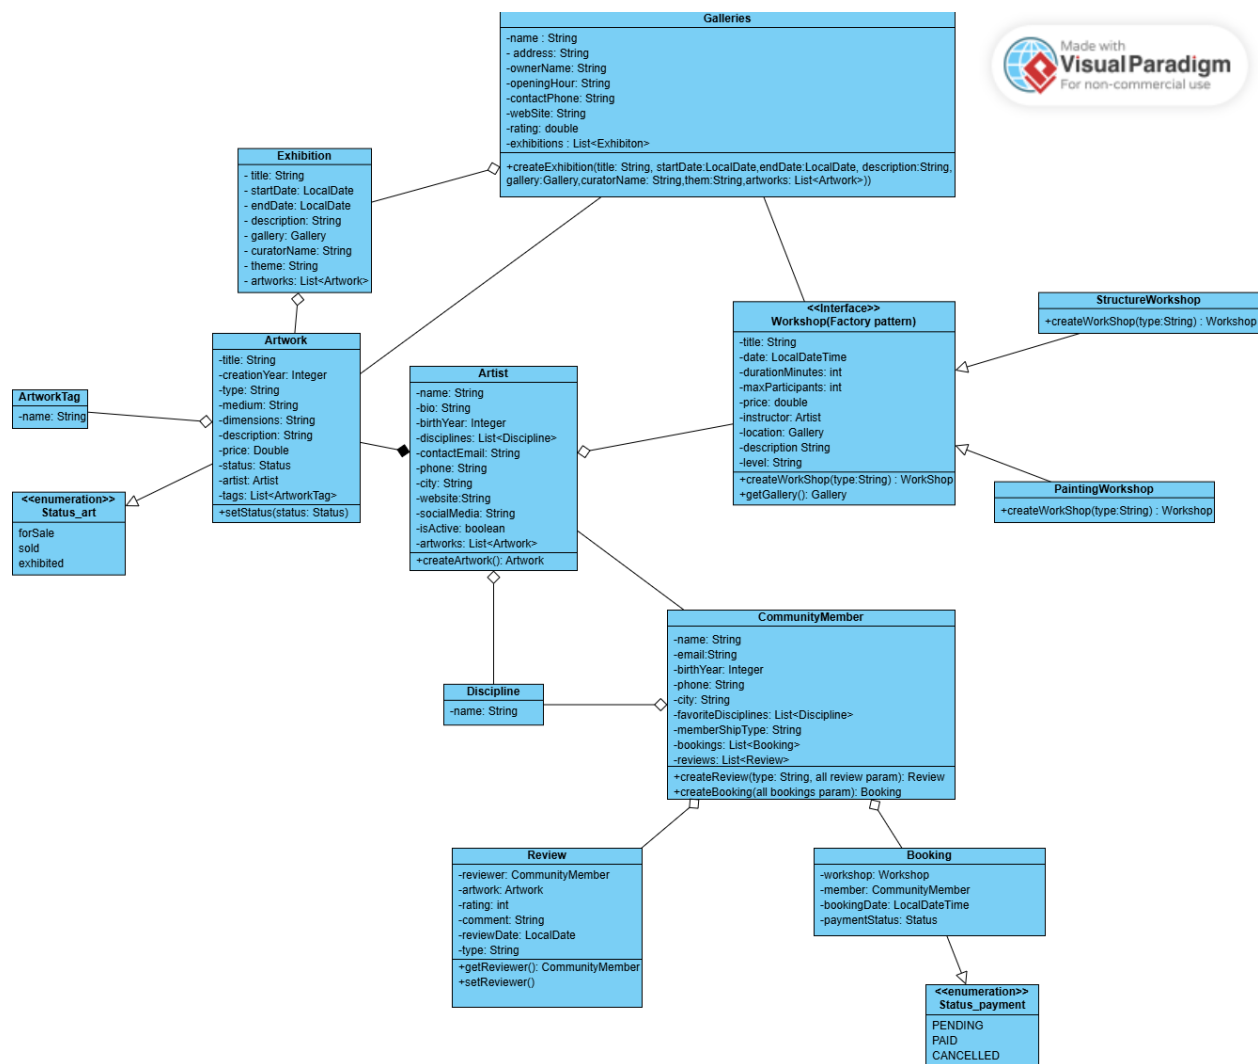

use case diagram (UML) representing the target features of ArtConnect from the actors' perspective.

3. Static design

Class diagrams

Create one (or more) class diagram(s) for the code. Preferably represent the model classes in a separate diagram.

Factory pattern to create workshops so we can generalize the common attributes and create specific workshops with their specificities.

We also modified the location in Workshop as it makes more sense to give a Gallery rather than a String that is the name of a gallery.
